Look What They're Doing With Combines!

"On-The-Go" Combine Grain Dryer

Dryer mounts above grain tank to minimize modification.

By Mark Newhall, Editor

Researchers at Agricultural Canada's research station in Quebec, Canada, have built an "on the go" combine grain dryer that makes use of combine exhaust heat.

The prototype add-on unit is designed for a Deere 6600 powered by a 6-329 diesel and equipped with a 6-row crop head. The exchanger, which draws heat off the engine, captures 100% of the heat lost through the cooling fluid and radiation.

Harvest Ear Corn With Your Combine

Now you can harvest unhusked ear corn with your combine, thanks to a new auger attachment invented by the late Norman Kracl, of O'Neil, Neb.

The attachment, powered off the feeder house drive chain, consists of a large 14 in. dia. horizontal auger inserted between the header and feeder house, and a 14 in. dia. vertical elevating auger. As ears are snapped off the stalks by the header, the auger intercepts them and moves them to the vertical auger for loading into a wagon or truck trailing alongside the combine.

(Continued on next page)

Elevating auger folds horizontal for transport.
