

Rebuilt Battery Packs “Better Than New”

If you have a power tool battery pack that's gone bad, you don't have to replace it. You can rebuild it instead, and it should be more powerful than ever.

“We rebuild more than 1,000 battery packs a month,” says Peter Peterson, Voltman Batteries. “We rebuild any brand. You will receive your original case back with brand new batteries on the inside.”

Peterson says the batteries are rebuilt better than the original. All connections between batteries are spot welded instead of soldering, which can create heat and damage cells.

“We've invested more than \$10,000 in each of our welding systems,” he adds. “Each strap receives several spot welds to ensure the best connection.”

We offer two options for rebuilding your NiCd/NiMH batteries. (Sorry, we don't rebuild Lithium). We'll install 2.2 ah cells for

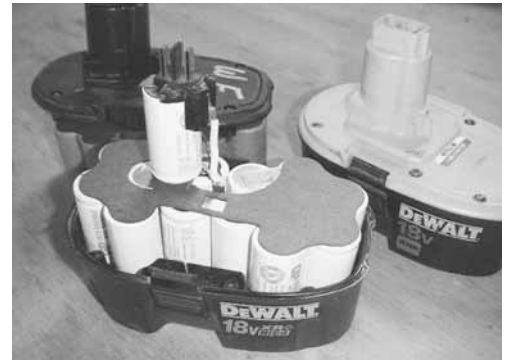

\$50 per battery, or Hi Capacity 3.0 ah cells for \$85 per battery. The Hi Capacity delivers 40% more run-time between charges, and lasts even longer than lithium. These prices are good for batteries 9.6 through 18 volt. Please call for other voltages. All rebuilds carry a one year warranty.

All old batteries are recycled. The company claims to recycle more than a million pounds of batteries each year.

Voltman Batteries will rebuild and return the pack within 2 weeks. Same-day-turn-around service for a \$20 premium is also available.

“Just prepay by phone or online, or enclose a check with the battery,” says Peterson. “We will replace every cell with new high drain cells, and when you get it back, it will be better than new.”

We also carry specialty and hard to find batteries. Call us for your special battery

needs, we'll ship them right to your door.

“Add-A-Valve”

The V&M Add-A-Valve plumbs into your tractor's existing hydraulic remote outlets. Now you have two outlets with a 15 gpm flow at a very low price.

The V&M Add-A-Valve can be mounted on your tractor or implement. You can “quick connect” to your tractor's remote hydraulic outlets if they are strong enough to support the extra weight - 5/16-in. holes are predrilled in the valve body for easy mounting on tractor or implement.

The V&M Add-A-Valve control grip is mounted on your hydraulic remote lever for easy one-handed operation. All you do is move the handle to direct flow on your primary outlet or depress button and direct flow for your secondary outlet.

The V&M Add-A-Valve works well for almost any hydraulic use. One-way Add-A-Valve's are also available. Takes just 30 min. to install.

New-style couplers are now available. Valves are available with or without couplers.

Super Add-A-Valve

V&M announces a new version of the Super Add-A-Valve.

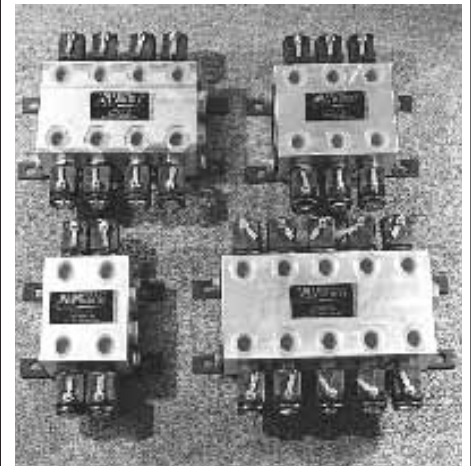

It flows up to 45 GPM and, with versions that take up to 5000 PSI, you can add extra functions to even more equipment. You don't have to have 40 GPM to work, though. The Super Add-A-Valve plumbs in between your hydraulic valve and cylinder to add an extra function to almost any system.

Grapple Forks, thumbs, and buckets are among the more common uses for this valve. It works anywhere you need an extra function up to the maximum flow ratings.

The Add-A-Valve is easy to use. The control clamps to the lever you move in the cab. Simply move the lever as before to use the original function. The “added” function works when you press a button down while moving the lever. The button is rated at up to 1 million cycles for long life.

SV Series Valves

The SV Series is a 6 to 8 gpm valve. It is available in a 2 through 8 bank valve. It works great for sprayers, hay equipment, blades, etc. The standard SV valve is designed with a check valve to keep your cylinder(s) from moving - even if your tractor's remote valve leaks.

The control handle mounts on your remote lever for easy one-handed control. With the unit's handle you can use multiple functions at the same time. The SV Series valve works on any tractor that has an existing hydraulic remote valve.

V&M also makes other valves with flows up to 40 gpm. If you have a need for extra outlets give V&M a call.
