

The Rebounder Has Your Seeds Covered

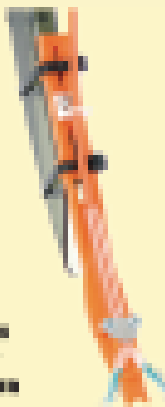

The Rebounder seed cover is a simple yet effective planting attachment that improves the accuracy and uniformity of seed placement on planters and drills. It offers many benefits that will pay off at harvest time.

The Rebounder has a patented cone-cone design that guides seeds to the bottom of the furrow. It enters the seed trench right behind the opening disc, and is shaped like the seed 'V'. The Rebounder gently rolls off the side walls, and forces its way to the bottom. Unlike products from other companies, the Rebounder does not press seeds into the ground, build up with mud, or break seeds.

The Rebounder is easy to install. It can be used with optional fertilizer blenders and attachments. The Y-Nut Spin-It is an attachment that fertilizes the sides of the seed 'V' and ensures that seeds will not be drenched with fertilizer. The Straight Shot attachment places liquid directly in the seed furrow under the Rebounder, eliminating mud buildup on the press wheels.
