The Rebounder Has Your Seeds Covered

The Rebounder seed cover is a simple yet effective planting attachment that improves the accuracy and uniformity of seed placement on planters and drills. It offers many benefits that will pay off at harvest time.

The Rebounder has a patented concave design that guides seeds to the bottom of the furrow. It enters the seed trench right behind the opening discs, and is shaped like the seed V. The Rebounder parts seeds off the side walls, and funnels them to the bottom. Unlike products from other companies, the Rebounder does not press seeds into the ground, hold up with mud, or knock seeds.

The Rebounder is easy to install. It can be used with optional fertilizer fittings and attachments. The V-Slot Split-II is an attachment that fertilizes the sidewalls of the seed V and ensures that seeds will not be drenched with fertilizer. The Straight Shot attachment places liquid directly on the seed from under the Rebounder, eliminating seed burning on the press wheels.
