

# Protect Your Lungs With RZ Mask's New M2.5 Mask

RZ Mask is excited to announce the launch of their new M2.5 Mask to the farming world in 2018. "This mask was built with farmers in mind," says founder Steve Torbenson, "I used a lot of the insight and the feedback I received while attending multiple National Farm & Machinery Shows in Louisville to design the M2.5 Mask."

The M2.5 Mask is constructed with an outer mesh shell, which is washable and reusable, and a replaceable inner active carbon filter. The active carbon filter boasts a staggering 99.9% efficiency rating (Nelson Laboratory tested) for particulates down to 0.1 micron. It's a fantastic solution for people exposed to breathing hazards around a farm such as dust, allergens, fumes, odors, animal waste, animal dander and much, much more. The filter typically lasts an average of 40 hours before needing to be discarded.

The M2.5 Mask uses the same features as those found in the very popular M1 and M2 Masks. These features include the two one-way discharge valves and the highly adjustable nose piece. These two features allow exhaled breath to escape the mask keeping the inside dry and prevent eyewear from fogging.

The key feature that sets the M2.5 apart from the popular M1 and M2 Masks is a dual strap system for holding the mask securely in place. "The single hook and loop strap of our original models is fantastic for quick ap-

plication and removal of the mask, however, when working on the farm you often need a bit more support," says Torbenson. "The dual strap system of the M2.5 Mask gives the user a more secure fit and allowing for increased mobility without losing that secure fit." The tested, quality filtration paired with a secure and comfortable outer mesh shell makes the M2.5 Mask a fantastic solution for grain bin cleaning, haying, handling livestock and numerous other tasks around the farm.

"We guarantee our RZ Masks to be the most comfortable and effective dust mask you've ever owned and offer a 100% money

back customer satisfaction guarantee," states Torbenson.

The M2.5 Mask retails for \$34.95 and comes with two (2) replacement active carbon filters and a convenient storage bag. The replacement filters are comparable in price to a disposable paper mask at just over \$2 per active carbon filter.

## Add-On "Suppressor" Makes Hydraulics Run Smoother, Quieter

The Wilkes & McLean Suppressor can reduce the noises, vibrations and wear found with large hydraulic systems. The in-line device absorbs shocks and suppresses noise, reducing pulsations, wear and leakage. "The Suppressor can be installed anywhere hydraulics are used," says Ben Finrock, Wilkes & McLean. "It is used on a lot of large agricultural and construction equipment."

The suppressor is nitrogen charged and easily recharged as needed. According to Finrock, how often it needs to be topped off depends on how often the hydraulics are used, as well as what they are used for and the type of fluid used.

The Suppressor is only 8 1/4 in. long, making installation easy. "Suppressors are sized by system flow and pressure as well as the size of the hydraulic line," says Finrock.

**Wilkes & McLean Suppressor is an in-line device that absorbs sound and, by reducing pulsations, reduces wear and linkage.**

Finrock says the company's Suppressor ranges in price from \$280 to \$800. The company sells them direct as well as through distributors. He says several large equipment manufacturers are testing the suppressors for possible factory installation.
