

So, What Exactly Is Chicken Soup for the Soil®?

Chicken Soup for the Soil® is a carbon based, colloidal, liquid fertilizer that contains all the nutrients and trace minerals we have identified over the years as being beneficial for the soil and plants; it literally brings the biology in dead soil back to life, grows large dense crops, tasty fruits and vegetables, higher quality buds, lush pastures, hay fields, and delivers all the nutrition your plants need to meet their maximum genetic potential.

Rather than force feeding plants with mainstream chemical fertilizer we suggest improving your soil by properly feeding the microbes all the nutrients found in Chicken Soup for the Soil® (microbes need to digest the nutrients in the soil before the plant can effectively use them).

Chicken Soup for the Soil® is structured in a way that makes it easy for microbes to consume, create new life, & fuel plants with everything they need to meet their maximum potential.

Feeding the microbes will ultimately help you grow happy fruits, vegetables, grass, & hay that have more color, taste better, have fewer problems, a longer shelf life, and are nutritious to eat. This Stuff Works!

When used as a liquid fertilizer concentrate for pastures and hay fields Chicken Soup provides all the nutrients and trace minerals for the grass and hay to be beneficial for horse, cattle, and other farm animals.

What is in Chicken Soup for the Soil®?

Chicken Soup is a 4-2-0; however, we focus on nutrient balance rather than guaranteed analysis. There is an array of essential amino acids, multiple sources of minerals, trace minerals and micro trace minerals all in natural chelated forms. We have an array of organic acids from mineral extracts and have multiple sources of carbon. We have an assortment of sea plant extracts. We also use some of the compounds found in sea fog that come from the respiration of sea plants as well as other important plant components. All ingredients are reacted into a colloidal nutrient that is non leaching and easy for microbes to consume, digest, and feed the plants at a biological level. When you have a healthy soil ecosystem and happy plants everything improves!

“You can feed microbes anything organic and they will reproduce, but when you feed them Chicken Soup for the Soil® their population explodes.” -Jim Zamzow
