Look What They're Doing To Combines!

New grain-saving deflector prevents grain build-up along combine sidewalls to eliminate grain loss on sloping as well as level ground.

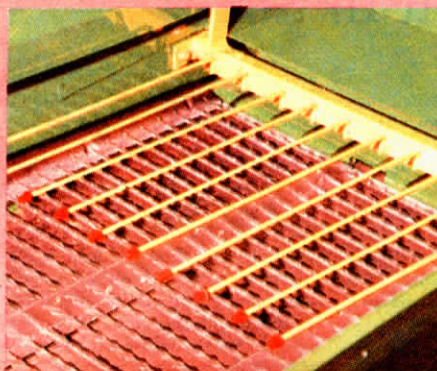

Slick New Way To Stop Grain Loss On Sidehills

"No one will ever know how many billions of dollars worth of grain have been needlessly lost out the back of combines on rolling ground," says Leland Harris, a Missouri inventor who's come up with simple new grain saving deflectors that stop grain build-up along combine sidewalls and "virtually eliminate grain loss on hillsides."

Harris worked with his son James Richard Harris to develop the low-cost grain saver. They farm 2,200 acres, all of it rolling ground near Miami, Mo. "We couldn't justify the cost of a sidehill combine," says Leland.

The grain saver consists of two 48-in. long angled deflectors that mount to the sidewalls of the combine just above the top cleaning sieve.

(Continued on page 22)

"The results are almost unbelievable," says inventor of the long-fingered Winn-O-Bar which eliminates grain loss over the shoe.

Crop-Saving "Fingers" Boost Combine Capacity

"This is one of the most important improvements ever made in the separation capacity of combines," says Jim Dayton, a Deere & Co. dealer who's excited about a new farmer-invented crop-cleaning add-on attachment for combines called the Winn-O-Bar.

It consists of 16-in. long steel fingers that mount in place of the vibrating shoe and finger bar on most combines. The long fingers move up and down and back and forth, extended out over the front third of the top crop-cleaning sieve. "All we did was activate and extend the finger bar that's already on 99% of all combines. The results are almost unbelievable," Dayton told FARM SHOW.

As crop material comes off the shoe, it goes out onto the vibrating fingers which agitate it.
