

NEW "BLADE AID" PREVENTS GOUGING

Turn Your 3 Pt. Blade Into A Grader

If you own a 3-pt. mounted tractor blade and want precision control of it, then you'll be interested in the new Blade Aid from Schweiss.

It's a two-wheeled steel carriage that conveys and controls any brand of 3-pt. tractor blade, turning it into a grader. It prevents gouging and digging when the tractor goes up an incline or swings around a corner by allowing the operator to change blade height and tilt angle to suit the situation.

Precision blade control makes the Blade Aid great for leveling farmyards, driveways and ditches. It's also handy for moving snow and for cleaning up, or re-forming field terraces.

"Just two bolts and one pin hold the blade to the Blade Aid. A double valve hydraulic system provides accurate, fingertip blade control," says manufacturer Harold Schweiss. "One hydraulic cylinder controls depth of cut while a second cylinder controls the blade's tilt angle. It's accurate enough to do light terrace or road building work yourself," he adds.

The Blade Aid fits virtually all 3 pt. blades and sells for \$900. Double valve controls and 3-pt. blade are extra, or you can use any brand you may presently own.

For more information, contact: FARM SHOW Followup, Schweiss, Inc., Box 557, Sherburn, Minn. 56171 (ph 507 764-2251).

Blade Aid gives you precision grading control. One cylinder controls depth of cut while a second controls the blade's tilt.

LETS YOU WINDROW OR MOW FROM THE LEFT OR RIGHT SIDE

Lundell Unveils "Swing Tongue" Rotary Mower

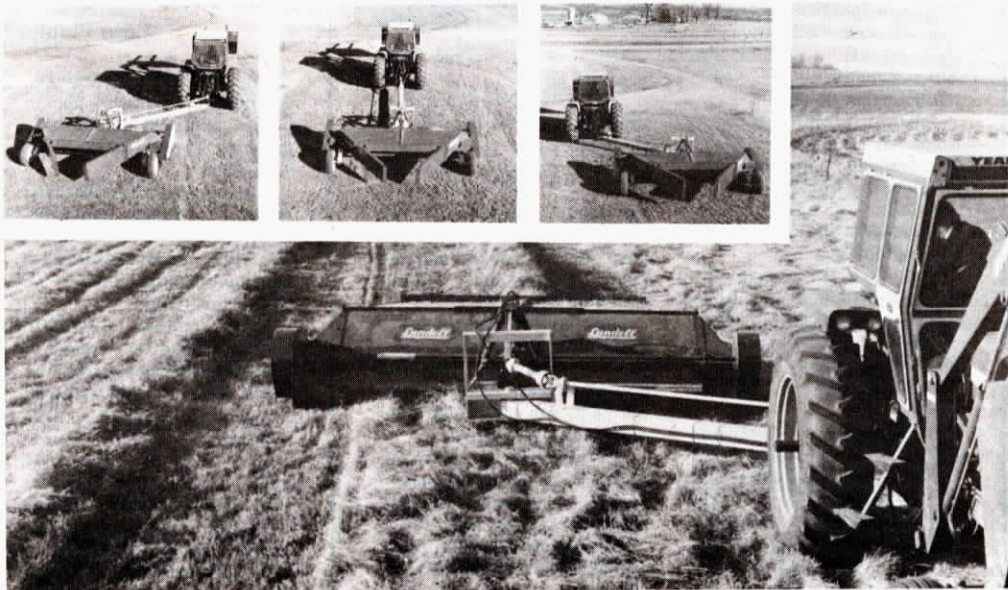

Lundell Mfg., Cherokee, Iowa, has scored another engineering "first" with its new "swing tongue" rotary mower-windrower.

The new "swing tongue" attaches to the front of the machine and is controlled by the operator right from the tractor's seat. Simply by flipping a hydraulic valve, he can windrow or mow from either the right or left side and straddle the windrow on the return across the field, eliminating having to drive on the crop.

The new front-mount "swing tongue" is available on all Lundell 12 and 14 ft. rotary mowers built since 1967.

Vern Lundell, president of Lundell Mfg., notes that regardless of how sharp the turn, the pto speed remains constant. What's more, the heavy-duty hitch is spring-loaded and free-floating to let the "swing-tongue" mower float in rough terrain. The drive line is equipped with a pto-assembly on each end of the center drive shaft, and is centered over 2 hitch pins to eliminate vibration on turning.

With the new "swing tongue" feature, Lundell rotary mowers are extremely versatile for mowing or swathing. For other jobs, such as shredding stalks, green chopping or

A flick of the hydraulic control lever moves the new Lundell "Swing Tongue" from one side to the other. Eliminates driving over windrows.

windrowing stalks for bedding, you can use the conventional hitch, or you can leave the "swing tongue" attached for these jobs as well. By

adding an optional hood attachment, you can also green chop into a trailing wagon.
